# Causal Models And Intelligent Data Management

**0 causality: models, reasoning, and inference** - models, and causal and statistical terminology+ chapter 2 builds the elements of chapter 1 into a theory of inferred causation+ chapter 3 focuses on causal diagrams and identifying causal effects+ chapter 4 studies intervention or manipulation and direct causal effects+ chapter 5 considers causality and structure- **chapter 13 graphical causal models - ssc - home** - progress in developing formal theories for graphical causal models that not only generalize the linear path diagrams of yore into a fully nonparametric framework but also integrate graphical models with the reigning potential outcomes framework of causal inference. **causality, causal models, and social mechanisms** - types of models: linear equations for variable oriented and boolean logic for case oriented. i adopt the "variable versus case" version of the distinction mainly because i find the emphasis on types of causal model fruitful. variable oriented social science research is also contrasted with mechanism approaches (hedström and swedberg 1998; **graphical causal models - cmu statistics** - causal graphical models, or graphical causal models.3 we make the following assumptions. 1. there is some directed acyclic graph  $g$  representing the relations of causation among the our variables. 2 the first person to really recognize this seems to have been the medieval muslim theologian and anti- **preliminaries: statistical and causal models - ucla** - preliminaries: statistical and causal models 3 be harmful overall is that, if we select a drug-user at random, that person is more likely to be a woman and hence less likely to recover than a random person who does not take the drug. put differently, being a woman is a common cause of both drug-taking and failure to recover. **causal inference - cdn1.sph.harvard** - about making causal inferences. our current goal is simply to motivate the need for models when trying to estimate population quantities like the mean  $E[Y]$ , irrespective of whether the estimates do or do not have a causal interpretation. now suppose treatment is a polytomous variable that can take 4 possible
